

Roles and Responsibilities – Sasi Kumar

Designation: Senior Software Developer – Windows Applications

Experience: 10 Years

Department: Software Development

Company: Kalpatharu Software Limited

1. Application Design & Development

I am responsible for the design, development, and maintenance of Windows-based business applications using Visual Basic 6.0. My work includes developing and modifying data entry forms, reports, and dashboards based on client and internal team requirements. I ensure seamless user experience through structured workflows and robust error-handling. I follow a consistent development process to maintain clean and maintainable code.

2. Database Development and Management

I design and implement SQL Server database components such as tables, views, stored procedures, functions, and triggers. These components support the backend logic of the application. I also optimize database queries to ensure high performance, data integrity, and accurate application behavior.

3. Crystal Report Development

I develop and manage reports using Crystal Reports 8.5. My reporting work includes both detail-level and abstract reports with grouping, dynamic field selection, and summary calculations. I handle modifications such as adding new fields, changing formats, and building export-ready layouts with minimal turnaround time.

4. Client Issue Handling and Support

I take ownership of any issues or bugs raised by the client. I aim to resolve critical issues within 24 hours of reporting. I perform root cause analysis and deliver permanent fixes while communicating with clients or support engineers for clarification. My goal is to ensure uninterrupted business operations.

5. Handling Change Requests and Enhancements

I manage change requests such as adding new fields, modifying existing screens, or enhancing reports. I complete minor enhancements within 3 days. For new module development, I coordinate with the Project Manager to gather specifications and complete the task within 1 week, ensuring quality and stability.

6. Requirement Analysis and Coordination

I actively participate in requirement discussions with project managers, consultants, and end users. I analyze the functional and technical aspects, estimate effort, and identify dependencies to deliver efficient solutions aligned with business needs.

7. Source Code and Version Control

I ensure that my source code is updated to the server daily. I maintain clear and well-commented code that is easy to understand and supports smooth handovers. I adhere to versioning protocols and maintain logs for all code changes.

8. Quality Assurance and Testing

I conduct unit-level testing of the features I develop. I work closely with QA teams by providing test cases and data, and address any bugs found during integration or user acceptance testing (UAT). My aim is to deliver stable, production-ready applications.

9. Documentation and Knowledge Management

I document all technical aspects of my work, including data structures, workflows, and logic. I maintain change logs and provide step-by-step usage guides for end users. I also prepare Excel mapping files for reports to support user understanding and internal references.

10. Training & Development Participation

I regularly attend internal training sessions led by Project Managers or consultants, often conducted during weekends. These sessions help me stay aligned with new system updates and contribute to knowledge sharing among peers, especially in legacy system handling.

11. Legacy System Maintenance

I manage and enhance legacy applications built in VB6. I propose improvements or refactor code when needed while preserving application stability. I also ensure these applications remain compatible with updated system environments and external integrations.

12. Soft Skills and Ownership

I am highly committed to deadlines and take full ownership of the tasks assigned to me. I possess strong problem-solving skills and can handle multiple priorities. I work independently and also support my team, offering guidance to junior developers and sharing best practices when required.

Summary of Commitments

- Bug Fix / Issue Resolution: Within 24 hours
- Minor Change (Field/Report Edit): Within 3 days
- New Module / Feature Development: Within 1 week
- Daily Source Code Update: End of each day
